

Planning Worksheet: Your Agentic Workflow

In pairs, ~20 minutes: design **one** agentic workflow for your company that uses an MCP server, and assess whether you could responsibly run it. Paper and pen. Nothing gets built today.

1. The idea, in one sentence

What will the agent let a user do? Pick a recurring task.

2. Goal & example requests

Goal: _____

Write 2 to 3 real questions or tasks you would give it:

1. _____
2. _____
3. _____

3. Why does this need an agent, and an MCP server?

An agent chooses which tool to use and when. What is the decision here? (If it is always the same single step, a simple automation is cheaper.)

Which existing system must it reach: mail, CRM, calendar, files? That is what the MCP server provides.

4. Find your MCP server(s)

First question for every use case: is there an official server from the vendor itself?
Official registry: registry.modelcontextprotocol.io · **Large catalogues:** pulsemcp.com · github.com/mcp · mcpservers.org · smithery.ai
With security ratings: mcpsafe.org · mcprisk.org · **Vendors' own servers:** Google, Notion, Figma and others increasingly ship their own

Field	Server 1	Server 2 (optional)
Name / provider		
What it does		
Runs: local / remote		
Auth & cost (free? key? billing?)		
Tools it offers (from the listing)		
Which of those tools do you actually need?		
Which scopes exactly? (mail: read + draft, calendar: read-only)		

5. Sketch the workflow

Boxes and arrows: user, agent, which tools and data, what comes back. Label each arrow with the tool name. Mark where content from outsiders enters and where anything leaves your company.

6. Security assessment

Run each shortlisted server through the vetting checklist (separate sheet), then record the result here.

Server	Verdict	Reasoning / required mitigations

- ☐ use it
- ☐ use it, with mitigations
- ☐ not in this context

Trifecta check for the whole workflow: ☐ private data ☐ outside content ☐ channel out

If all three: where is the **human approval step**? _____

7. Next steps to a pilot

Who owns this? _____

What system access is needed, and who grants it? _____

What approval is required before a pilot? (works council, IT security, data protection) _____

Pitch, 3 minutes: your idea · your server(s) · your verdict.
